Forecast.</font><BR><br />
```

```html
<P class=mtx align=justify><FONT style="FONT-FAMILY: Verdana; FONT-SIZE:
14px">We presents a new approach to forecast the behavior of time series
based on similarity of pattern sequences. clustering techniques are used with
the aim of grouping and labeling the samples from a data set. The prediction
of a data point is provided as follows: the pattern sequence prior to the day
to be predicted is extracted. Then, this sequence is searched in the
historical data and the prediction is calculated by averaging all the samples
immediately after the matched sequence. The main novelty is that only the
labels associated with each pattern are considered to forecast the future
behavior of the time series, avoiding the use of real values of the time
series until the last step of the prediction process. Results from several
energy time series are reported and the performance of the proposed method is
compared to that of recently published techniques showing a remarkable
improvement in the prediction.</FONT></P>
